

# The WHEAT SITUATION

FEBRUARY 1961  
FOR RELEASE  
MAR. 1, A. M.

WS-172

Stocks of hard red winter wheat constituted about 75 percent of the 1,314 million bushel total carryover July 1, 1960. Stocks of this class of wheat have been increasing sharply and next July 1 they are expected to be 12 times as large as in 1952, when wartime demands had drawn stocks down to low levels. Stocks of hard red spring wheat may be twice as large as in 1952.

The total wheat carryover July 1, 1961 is expected to be about 170 million bushels above that of a year earlier. Expected increases of about 175 million bushels in hard red winter and 15 million in hard red spring much more than offset a possible 25-million-bushel decline in white wheat. Little change is indicated in the carryover of soft red winter and durum wheats.

SUMMARY

The prospective "free" supply of wheat appears adequate to take care of domestic requirements and exports for the remainder of the marketing year provided the supply is well distributed and the 1961 harvest is not unduly delayed.

Of the total stocks of 2,066 million bushels of wheat on January 1-- a record for the third successive year-- 1,133 million bushels were owned by the Commodity Credit Corporation, 380 million under loan, 19 million under purchase agreements and 31 million held by farmers to avoid payment of penalty for overplanting allotments. This would leave 503 million bushels in free supplies out of stocks. In addition, in the January-June period, imports may total around

4 million bushels and purchases of wheat from CCC stocks at the statutory minimum may amount to possibly 5 million bushels. This would indicate a total free supply for the last half of the 1960-61 marketing year of 512 million bushels.

Requirements for domestic use and exports in January-June from this free supply may total some 452 million bushels. This would leave about 60 million bushels in free supply next July 1, compared with 23 million bushels last July 1 and 51 million bushels July 1, 1959. Redemptions of loan wheat and sales of purchase-agreement wheat will increase the free supply.

Cash wheat prices at terminals reached their highs for the marketing year to date in late January and early February. At that time, prices were generally at or above support levels and had advanced to a point where wheat from free supplies was sold in increased quantities by farmers and other holders. The heavy sales caused a market reaction and on February 21 prices were still as much as 4 cents below their highs.

However, even with the setback, prices are still generally favorable compared with the effective support. On February 21, the price of No. 1 Soft White at Portland at \$2.14 was 16 cents above the effective support; No. 2 Soft Red Winter at St. Louis at \$2.16 was 10 cents above; No. 2 Hard Winter, ordinary protein, at Kansas City at \$2.03, 3 cents below and No. 1 Dark Northern Spring, ordinary protein, at Minneapolis at \$2.12, 2 cents below. The strength in market prices reflects the exceptionally heavy export demand, together with the operation of the price support program. While prices of all classes of wheat rose to near or above the effective support rates, prices of soft red winter and white wheat were especially high relative to the support. Supplies of these two classes are in relatively close balance with likely takings in the last half of the marketing year.

Total supplies of wheat for the 1960-61 marketing year are now estimated at 2,684 million bushels, an increase of 10 percent from a year earlier. Domestic disappearance is estimated at about 610 million bushels, about the same as a year earlier. Exports are now expected to total about 590 million bushels. On the basis of these estimates, the carryover on July 1, 1961 would be a record 1,485 million bushels. This would be about 170 million bushels or 13 percent above the 1,314-million-bushel record last July 1.

An expected increase of around 175 million bushels in the July 1, 1961 carryover of hard red winter and around 15 million in hard red spring wheat would more than offset a possible 25-million-bushel decline in white wheat. Little change in carryover stocks of soft red winter and durum are expected.

The intentions-to-plant report, which will be issued March 17, will give an indication of the acreage of spring wheat farmers intend to plant. The first official forecast of spring wheat production will be released June 9. If 12.4

million acres are seeded to spring wheat, the same as last year, and yields equal to the average of the last 3 years of 19.3 bushels per acre are obtained, a spring crop of about 240 million bushels would be produced. Adding this to the indicated winter wheat crop of 1,034 million bushels, a total wheat production of nearly 1,275 million bushels is indicated for 1961. This is 7 percent below the 1960 crop but 16 percent above the 1950-59 average. In recent years, the final crop estimates have exceeded the indication as of December 1 because growing conditions after that date have been above average.

A crop of 1,275 million bushels would be 90 million bushels in excess of estimated domestic disappearance of 610 million, which is about the same as estimated for 1960-61, and exports assumed at 575 million. As a result, the carryover July 1, 1962 again would be increased.

World wheat exports, including products in grain equivalent, in 1960-61 are expected to be 75 million to 100 million bushels above the previous record of 1,328 million attained in 1956-57. Exports for 1959-60 were 1,321 million bushels.

Winter wheat prospects in Europe are not favorable. Excessive rains caused serious delays in seedings through the fall and early winter of 1960-61, resulting in considerably smaller fall-sown acreage than last year.

--

#### THE DOMESTIC WHEAT SITUATION

#### Total Stocks on January 1 Set Record for Third Straight Year

For the third successive year, total stocks of wheat stored in all positions set a record. On January 1, they amounted to 2,066 million bushels, 10 percent above a year ago and 60 percent above the 1950-59 average (table 2 ). They were 52 percent larger than the 1960 crop, which was the second largest crop ever harvested.

Off-farm wheat stocks on January 1 totaled 1,645 million bushels and farm stocks 421 million. Nearly three-fourths of the total stocks were either owned by the Government or were under Government loan.

1/ From reports of the Grain Division, Agricultural Marketing Service. 2/ Data not available for October 1, prior to 1934, or for January 1 and April 1, prior to 1935. 3/ Estimated total based upon Bureau of Census report of item "In mills and mill elevators attached to mills" for 1927 through April 1945. Data not available for October 1 prior to 1931, or for January 1 and April 1 prior to 1932. 4/ Beginning July 1, 1942, wheat owned by CCC and stored in bins or other storage owned or controlled by CCC. Other wheat owned by CCC as well as wheat outstanding under loan is included in other positions. 5/ Beginning with 1937 only old crop wheat shown in all positions. For the years 1927-36 inclusive, some new wheat is included in terminal and merchant mill stocks. The figure for July 1, 1937, including the new wheat, is 102,842,000 bushels. 6/ Beginning October 1, 1957, merchant mills and beginning January 1, 1960, terminal market included with interior mill, elevator and warehouse stocks.

The CCC wheat inventory on January 1 consisted of approximately the following quantities by classes, in million bushels, with 1960 comparisons in parentheses: Hard red winter, 867 (844); hard red spring, 183 (185); white, 51 (55); durum, 8 (10) and soft red winter, 0.3 (0.7), (table 28). The total of these January 1, 1961 figures, taken from operating reports of the Commodity Credit Corporation, differ slightly from the 1,133-million-bushel total from fiscal reports which do not break down holdings of wheat by classes or by States. The 1,133 million bushels owned by CCC on January 1, 1961 compares with 1,109 million on January 1, 1960 and 777 million 2 years ago.

July 1, 1961 Carryover Expected

To Reach 1,485 Million  
Bushels, Up 13 Percent

Total supplies of wheat for the 1960-61 marketing year are estimated at a record 2,684 million bushels, 255 million bushels or 10 percent above the previous record of a year earlier and 14 percent above 2 years earlier. Total supplies include the carryover of 1,314 million bushels, the 1960 crop estimated at 1,363 million and probable imports of 7 million. Imports are mostly of feeding quality and seed wheat, of which 2.9 million were imported in July-December.

Domestic disappearance of wheat in 1960-61 is estimated at about 610 million bushels, about the same as a year earlier. Exports are now expected to total about 590 million bushels.

On the basis of the estimated supply and disappearance, the carryover on July 1, 1961 would be a record 1,485 million bushels (table 1). This would be about 170 million bushels or 13 percent above the record last July 1.

Total disappearance of wheat in July-December of 1960 amounted to 614 million bushels -- 65 million bushels or 12 percent above the same period in 1959 and 133 million bushels or 28 percent above the 1954-58 average. Compared with the same period in 1959, exports of 298 million bushels were 92 million larger and domestic food use of 253 million were 1 million larger. However, feed use (residual) was 13 million bushels, 29 million smaller, and seed use was 49 million bushels, about unchanged from the same period in 1959.

Wheat Consumption Per Person

Continues Slight Downward Trend

The total quantity of wheat used as food in continental United States is little different today from what it was 50 years ago. The decline in per-person consumption has been offset by the increase in population. The total quantity consumed in 1960, 484 million bushels, was only slightly larger than the 478 million in 1910.

1/ Preliminary.

2/ Public Law 480, 83rd Congress, as amended.

3/ Includes all exports of wheat and flour under the following authorities: P.L. 806, 80th Congress, CCC Charter Act; P.L. 85, 81st Congress, CCC Charter Act, amended; P.L. 439, 81st Congress, Agricultural Act of 1949; P.L. 480, 83rd Congress, Agricultural Adjustment Act of 1954; P.L. 690, 83rd Congress, Agricultural Act of 1954 and P.L. 540, 84th Congress, Agricultural Act of 1956.

4/ Shipments by U. S. charity and relief agencies as authorized under Title III of P. L. 480, Section 416.

5/ P. L. 472 (4/3/48), Foreign Assistance Act of 1948. Original Act establishing Economic Cooperation Administration (now known as International Cooperation Administration, P. L. 665, Section 402). Includes, in part, exports under Greek-Turkish Aid, China Aid, Yugoslav, India and Pakistan Relief programs. In most years data represent procurement authorizations, and are not strictly comparable in time to actual exports of wheat and wheat flour.

6/ Shipments for civilian feeding in occupied areas.

Grain and Feed Division, Foreign Agricultural Service.

FEBRUARY 1961

Consumption averaged 164 pounds per person in the calendar year 1960, down 2 pounds from a year earlier and down 66 pounds from 1945. Except for 1958, per-person consumption has declined every year since 1945. The 164 pounds of wheat consumed per-person in 1960 was only a little more than half of the 315 pounds per capita of a half century ago.

Because of the increase in population, total consumption of wheat for food declined by a smaller percentage from 1945 to 1956 than per-person consumption. The total consumption for 1960 of 484 million bushels was down only 2 percent from the 495 million in 1945. The 487 million in 1960 represented a 3 percent increase from the 468 million bushels in 1956.

U. S. Exports in 1960-61 Estimated At  
590 Million Bushels, an All-Time Record

Wheat exports, including products in grain equivalent, in 1960-61 are expected to set an all-time record of 590 million bushels compared with 510 million bushels in 1959-60. The previous high of 550 million bushels was reached in 1956-57. Programming under P. L. 480 has been expanded and dollar sales are larger.

Wheat and flour exports during July-December 1960 totaled nearly 298 million bushels, setting a new record for the first half of any marketing year. Exports under Title I, P. L. 480 were 172 million bushels, an increase of 67 percent over the first half of 1959-60.

The small harvest in Southern Europe has changed Spain and Italy from exporters to substantial importers. Increased imports of U. S. wheat by these countries plus slight increases in several other traditional-dollar-sales countries may cause a substantial increase in dollar exports.

In the first 6 months of the 1960-61 marketing year, U. S. exports of wheat (including flour) to principal importers, in millions of bushels, with last year's figures in parentheses were as follows: Brazil, 11 (23); Egypt, 23 (15); India, 81 (34); Italy, 12 (5); Japan, 20 (16); Pakistan, 16 (7); Poland, 27 (10) and Spain, 7 (0).

Large Increase Expected in  
Carryover of Hard Red Winter  
Wheat; Decrease in White Wheat

Analysis of supply and distribution by classes indicates probable changes in the distribution of the carryover by classes on July 1, 1961, compared with July 1, 1960. 1/

---

1/ The various classes of wheat are used for different purposes. The hard red winter and hard red spring wheats are especially suited to the making of bread flour. Flour from soft red and soft white wheats are used in the making of pastry, crackers, biscuits and cakes. Durum wheat is used in the manufacture of macaroni, spaghetti and similar products.

<sup>1/</sup> Figures by classes are not based on survey or enumeration data and are therefore only approximations. Estimated stocks on farms and in interior mills, elevators and warehouses, by kinds, are assumed to be present in about the same proportion as produced; the classes within kinds are established on the basis of the quinquennial wheat-variety surveys. Commercial stocks and CCC inventories are reported by classes. Exports by classes are estimated on the basis of "inspection for export" for wheat as grain and on the basis of the area from which exports are made for flour. <sup>2/</sup> Excludes imports for milling-in-bond and export as flour. <sup>3/</sup> Includes shipments to Alaska and Hawaii and the U.S. Territories. Includes exports for relief or charity by individuals and private agencies. <sup>4/</sup> Wheat for food (including military food use at home and abroad), feed, seed and industry. <sup>5/</sup> Preliminary. <sup>6/</sup> Imports and distribution are partly estimated.

Data for 1944-55 in The Wheat Situation, August 1959, page 12; data for 1929-43 in The Wheat Situation, February 1958, page 10.

Total carryover on July 1, 1961 is estimated at 171 million bushels above a year earlier. An indicated increase of 175 million bushels in hard red winter and 15 million hard red spring much more than offsets a possible 25-million-bushel decline in white wheat (table 5). The increases indicate that last year's production of hard red winter and hard red spring wheats were in excess of domestic disappearance and exports. The carryover of durum may be up about 3 million bushels 2/. The expected reduction in the white wheat carryover reflects the smaller crop in 1960.

Carryover stocks of hard red winter wheat have almost doubled since the 613 million bushels on July 1, 1958 and continues exceedingly large. Stocks of hard red spring are more than ample but may not be considered burdensome. Stocks of soft red winter, white and durum are not large.

Table 5.- Wheat: Estimated July 1, 1961 carryover by classes, with comparisons

Total	1,049	256	1,314	1,485	142	+1,229	+171

1/ Year begins July 1. Includes exports and domestic use for food, feed, seed and industry. 2/ A year when wartime demands drew stocks down to low levels.

The prospective carryover stocks of the various classes next July 1 as a percentage of the 1955-59 average disappearance are as follows: Hard red winter, 245 percent; hard red spring, 129 percent; durum, 58 percent; white, 23 percent and soft red winter, 7 percent (table 5).

2/ Durum became eligible for export payments under the payment-in-kind export program on December 27, 1960. It was announced that a separate rate would be announced daily by the CCC on commercial export sales. Durum wheat was last exported in substantial quantities in 1956-57, when approximately 11 million bushels were sold for export.

1/ Preliminary.

Footnotes for table 21, page 34 and table 22, page 35.

1/ Includes flour and other wheat products in terms of wheat. 2/ Prior to 1937 some new wheat included; beginning with 1937 only old-crop wheat is shown in all stocks positions. The figure for July 1, 1937, including the new wheat, is 102.8 million bushels, which is used as year-end carryover in the 1936-37 marketing year. 3/ Imports include full-duty wheat, wheat imported for feed, and dutiable flour and other wheat products in terms of wheat. They exclude wheat imported for milling in bond and export as flour, also flour free for export. 4/ Includes procurement for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at time of procurement, not at the time of shipment overseas. 5/ Exports as here used, in addition to commercial exports of wheat, flour and other wheat products, include United States Department of Agriculture flour procurement rather than deliveries for export. For the years 1941-54, actual exports, including those for civilian feeding in occupied areas (deliveries for export) of wheat, flour and other wheat products, in million bushels, were as follows: 27.9; 27.8; 42.6; 144.4; 390.6; 397.4; 485.9; 504.0; 299.1; 366.1; 475.3; 317.8; 217.0 and 274.4. 6/ To Alaska, Hawaii and U. S. Territories; partly estimated. 7/ Includes exports for relief or charity by individuals and private agencies. 8/ Preliminary. 9/ For the period July-December 1955, known disappearance from the July 1 supply, without an allowance for quantities fed, is about 12 million bushels larger than that indicated by January 1 stocks. This discrepancy may be accounted for by possible inexactness in data, including some duplication in stocks reported in the various positions by different agencies. This discrepancy also occurred in the July-December 1957 period by 8 million bushels.

Indicated Winter Wheat Crop  
25 Percent Above Average

In December, seedings of winter wheat for all purposes were estimated at 43.9 million acres, slightly above the 43.2 million planted last year, but 9 percent below the 1950-59 average (table 6). The 1961 winter wheat crop, seeded in the fall of 1960, was planted under acreage allotments and marketing quotas with the same national wheat allotment as last year-- 55 million acres.

A 1961 winter wheat crop of 1,034 million bushels is indicated, based on conditions as of December 1. This assumes average weather and insect and disease conditions for the remainder of the season. A crop of this size would be about 7 percent less than that of 1960 but almost 25 percent above the 1950-59 average of 840 million bushels. In the last 10 years, the average change in the production estimate from December to harvest has been 134 million bushels, ranging from a minimum change of 5 million bushels to a maximum of 274 million.

The indicated yield of 23.6 bushels per seeded acre is below the near-record of 25.9 bushels last year, but substantially above the average of 17.6 bushels. Current indications are that 6.6 percent of the acreage seeded for harvest in 1961 will not be harvested for grain. This is about the same proportion as a year ago but less than half of the 10-year average of 16.5 percent.

The low temperatures during late January were not expected to cause undue damage to fall sown wheat because most areas had some protective snow cover. Exceptions were the Central and Northern Great Plains, where fields were generally free of snow and dry surface soils were vulnerable to blowing. Fall-seeded wheat in the Pacific Northwest continued in good condition through January with plant growth ahead of normal. Snow cover in the Great Lakes and northeastern sections provided ample protection to fall wheat. Below-normal temperatures in the Gulf and southeastern regions retarded growth of small grains. In early February heavy snowfall covered practically all of the winter wheat belt.

New Record High Carryover  
Expected on July 1, 1962

The intentions-to-plant report, which will be issued March 17, will give an indication of the acreage of spring wheat farmers intend to plant. The first official forecast of spring wheat production will be released June 9. If 12.4 million acres are seeded to spring wheat, the same as last year, and yields equal to the average of the last 3 years of 19.3 bushels per acre are obtained, a spring crop of about 240 million bushels would be produced. Adding this to the indicated winter wheat crop of 1,034 million bushels, a total wheat production of nearly 1,275 million bushels is indicated for 1961. This is 7 percent below the 1960 crop but 16 percent above the 1950-59 average.

1/ Cash grain closing prices are not the range of cash sales during the day but are on-track cash prices established at the close of the market. The terminal rate is a rate used in determining the effective support price for grain in terminal storage or in transit to terminal and for calculating most county price support rates. The effective support price is the established terminal support rate for grain received by rail minus the deduction for storage as of the date shown. A comparison of the above effective price support rate and the current cash closing price is an indication of whether the market price is above or below the support rate provided the location of the grain is on track at the specified terminals. The monthly average price is the simple average of the daily closing prices.

2/ Galveston effective and terminal support price. The cash price at Fort Worth is usually backed by paid-in freight which will carry it to Galveston. Therefore, cash prices at Fort Worth may usually be compared with the effective support price at Galveston. A terminal support price is not established for Fort Worth.

3/ Applies only to the varieties Baart and Bluestem of the sub-class Hard White.

FEBRUARY 1961

A crop of 1,275 million bushels would be 90 million bushels in excess of estimated domestic disappearance of 610 million, which is about the same as last year, and exports assumed at 575 million. As a result, the carryover July 1, 1962 again would be increased.

Wheat Prices Advance  
Sufficiently to  
Increase Sales

Cash wheat prices at terminals reached their highs for the marketing year to date in late January and early February. At that time, prices were generally at or above support levels and had advanced to a point where wheat from free supplies was sold in increased quantities by farmers and other holders. The heavy sales caused a market reaction and on February 21 were still as much as 4 cents below their highs.

However, even with the setback prices are still generally favorable compared with the effective support. On February 21 the price of No. 1 Soft White at Portland at \$2.14 was 16 cents above the effective support; No. 2 Soft Red Winter at St. Louis at \$2.16 was 10 cents above; No. 2 Hard Winter, ordinary protein, at Kansas City at \$2.03, 3 cents below and No. 1 Dark Northern Spring, ordinary protein, at Minneapolis at \$2.12, 2 cents below. Compared with the season's lows, prices for dominant classes and grades were up about 33 cents at St. Louis, 20 cents at Portland, 19 cents at Kansas City and 10 cents at Minneapolis.

The overall strength in market prices reflects the exceptionally heavy export demand, together with the operation of the price support program. While prices of all classes of wheat rose to near or above the effective support rates, prices of soft red winter and white wheat were especially high relative to the support. Supplies of these two classes are in relatively close balance with likely takings in the last half of the marketing year.

The net quantity of 1960-crop wheat under the loan program reported through January 31 totaled 321.7 million bushels, 76.8 million bushels having been redeemed out of a total of 398.5 million bushels put under loan (table 9). In addition, 18.7 million bushels of 1960-crop wheat were under purchase agreements. Farmers also had under 1959-crop reseal, 25.3 million bushels, 1958-crop extended reseal of 28.5 million bushels and 1957-crop re-extended reseal of 4.9 million bushels. A year ago, the net quantity of 1959-crop wheat amounted to 260.4 million bushels and purchase agreements, 19.9 million.

Season Average Price of 1960-Crop  
Wheat Estimated at About 6 Cents  
Above Effective Support

The season average price received by farmers for the 1960 wheat crop was estimated at \$1.75 per bushel compared with \$1.76 for the 1959 crop. This season's estimate is based on sales through November with an allowance

Grain Division, Commodity Stabilization Service.

for marketings for the remainder of the marketing year and for unredeemed loans at the average rate.

The estimated price for the 1960 crop is about 6 cents above the effective support rate, assuming about 9 cents for storage charges from the \$1.78 announced rate. The price for the 1959 crop was about 4 cents above the effective support.

On the basis of the average price, the value of production of the 1960 crop is estimated at \$2,383 million, 20 percent above the \$1,985 million for the 1959 crop and 16 percent above the 1954-58 average of \$2,060 million.

#### Payments Advanced on Resealed Loan Wheat

A program providing for advance payments on grain resealed was announced on February 8. One-half of the storage payments for reseal of farm-stored wheat under price support loans for the 1960-61 storage season will be advanced to farmers in early March. Advance storage payments will be made on 1957-59 crop wheat resealed. These advance storage payments will be made at the rate of 7 cents per bushel. Remaining storage payments due will be paid after the maturity date of the loans. The program, which also includes payments on other reseal grains, enables farmers to hold their price-supported grains in farm storage for another year and at the same time provides payments to help defray storage costs.

#### Free Wheat Supply May Exceed 6-Month Requirements by 60 Million Bushels

The prospective "free" supply of wheat of about 512 million bushels appears adequate to take care of domestic requirements and exports for the remainder of the marketing year provided the supply is well distributed and the 1961 harvest is not unduly delayed.

Of the total stocks of 2,066 million bushels of wheat on January 1-- a record for the third successive year--1,133 million bushels <sup>3/</sup> were owned by the Commodity Credit Corporation, 380 million under loan, 19 million under purchase agreements and 31 million <sup>4/</sup> held by farmers to avoid payment of penalty for overplanting allotments. This would leave 503 million bushels in free supplies out of stocks. In addition, in the January-June period, imports may total around

---

<sup>3/</sup> On June 30, 1960 this quantity was 31.0 million bushels and a year earlier it was 34.4 million bushels (table 27).

<sup>4/</sup> As reported by the Fiscal Branch, CSS, compared with 1,109 shown by operating reports which provides a breakdown by States and by classes of wheat.

Supplies available for export and carryover	2,909	2,960	3,272
Exports, season through January 31 <u>2/</u>	420	421	548
Supplies on February 1 for export and carryover	2,489	2,539	2,724

1/ Estimated requirements for seed, food (milling for domestic use), and feed for the season.

2/ Exports of wheat and flour in grain equivalent.

3/ Without imports.

4 million bushels and purchases of wheat from CCC stocks at the statutory minimum may amount to possibly 5 million bushels. This would indicate a total free supply for the last half of the 1960-61 marketing year of 512 million bushels.

Requirements for domestic use and exports in January-June from this free supply may total some 452 million bushels. This would leave about 60 million bushels in free supply next July 1, compared with 23 million bushels last July 1 and 51 million bushels July 1, 1959. The requirements noted exclude an estimated 105 million bushels to come from CCC stocks for payment-in-kind, barter, donations and other export payments.

Redemptions of loan wheat and sales of purchase-agreements wheat will increase the indicated free supply.

#### THE WORLD WHEAT SITUATION

##### World Wheat Exports to Set Record 5/

World wheat exports, including products in grain equivalent, in 1960-61 are expected to be 75 million to 100 million bushels above the previous record of 1,328 million attained in 1956-57. Exports for 1959-60 were 1,321 million bushels.

The severe crop failure in Communist China has resulted in their purchases of over 80 million bushels of wheat from Australia and Canada. The possibility exists that additional purchases may materialize in the near future.

Southern Europe also had much smaller wheat crops. Italy and Spain, both exporters in The International Wheat Agreement, will require large imports in 1960-61. While the weather conditions in the Near East are more favorable than they have been for a number of years, Syria, Iran and several other countries are importing substantial amounts of wheat. Also, requirements in Asia, particularly India and Pakistan, are greater and increased quantities are expected to be taken by these countries.

Total wheat supplies are generally higher than a year ago, with Australia having an all-time record harvest. Supplies in Canada and the United States are also above last year's level. However, Argentina will have a smaller quantity available for export as the result of a below-average harvest. A smaller wheat crop in France will reduce their exports slightly. U.S.S.R. exports are expected to decrease somewhat from the high level of recent years primarily as the result of a decline in production. Several minor exporters have insignificant amounts, if any, available for export, namely Uruguay and Sweden.

Winter Wheat Prospects  
in Europe and Asia 6/

Prospects for winter wheat in Europe are not favorable. Excessive rains caused serious delays in seedings throughout the fall and early winter of 1960-61, resulting in considerably smaller fall-sown acreage than last year. The rains continued through January and in large areas prevented late sowing of winter varieties. Spring seeding may offset part of the loss. Condition of the growing crop in a number of countries has also been adversely affected by the rains.

Available information follows for countries which normally account for about 90 percent of Western Europe's wheat production.

Belgium and The Netherlands -- Rains forced planting delays and seeding was still behind schedule at the beginning of January.

France -- Seeded acreage on January 1 was officially placed at 6.6 million acres, compared with more than 10 million acres which are normally planted to wheat by that date. Dry weather is urgently needed for grain in the ground and to make field work possible. Condition of the seeded acreage is reported poor over large areas.

West Germany -- Fall-sown wheat acreage was smaller than expected and the general crop condition is considered below normal. Planting delays were general but have been worst in northern parts. Harvesting of root crops was especially late in the north, interfering with the seeding of grains as did the wet fields. Winterkill has been negligible so far.

Greece -- Wheat acreage is about 9 percent less than last year. Unfavorable weather and lower prices contributed to the reduction.

Italy -- Conditions vary widely, being poor in many regions and good in others. Following heavy rains throughout the fall and much of the winter, acreage was curtailed, especially in the north where yields are normally highest. More than a million acres of the country's wheat land was unseeded.

Portugal and Spain -- Wet, cold weather interfered with seeding in Portugal and much of the acreage intended for wheat was not utilized. The outlook is also poor in Spain. Persistent rains held up seeding and only about two-thirds of last year's acreage had been seeded by the end of January.

United Kingdom -- Wheat acreage seeded by December 1 was only about 36 percent of the acreage seeded by the corresponding period of 1959. Indications are that there will be a big shift to barley when spring sowings begin.

Seeding in Eastern Europe was also hampered by wet weather. Yugoslavia -- Only about 91 percent of the planned acreage was seeded, but with a considerable increase in the area planted to high-yielding Italian varieties. The crop is in good condition and no winter damage has been reported. East Germany -- Heavy rains and late harvesting of root crops caused serious delays in fall grain seeding. Lower yields are expected this year because of unfavorable conditions.

Reports are available for only scattered areas of Asia. India -- Grain prospects are excellent and the harvest, starting in March, is expected to be a record one. Pakistan -- Production is expected to be some 20 percent less than in 1960 mainly because of severe drought at seeding time.

1960 World Wheat Production  
19 Percent Above Average, 5  
Percent Below 1958 Record 7

World wheat production in 1960, as reported in January, is now estimated at 8,300 million bushels, 2 percent above the 8,150 million a year earlier but 5 percent below the record outturn of 8,700 million in 1958 (table 12). The current crop is 19 percent above the 1950-54 average of 6,975 million bushels. The most significant increase over 1959 wheat production is in North America, where a 20 percent increase is reported. Smaller increases for Asia and Australia are partly offset by reductions in Europe, the Soviet Union and South America.

In North America, wheat production is placed at 1,905 million bushels, compared with the small crop of 1,594 million in 1959. This is a record total for the area because of a near-record U. S. outturn and a fairly good harvest in Canada.

The wheat crop for all Europe is still estimated at 1,900 million bushels, compared with the 1959 record total of 2,055 million. Reductions occurred in both Western and Eastern Europe. Lower quality wheat, as well as reduced production, is reported for a number of countries.

Unfavorable weather in parts of the Soviet Union apparently reduced grain crops below their expected level, and the actual or "barn harvest" of breadgrains is now believed to be less than in 1959. Earlier prospects were for larger outturns than last year.

Asia's 1960 wheat crop is still estimated at 1,965 million bushels. This is moderately above the 1959 total of 1,905 million bushels and is 11 percent above the 1950-54 average. A good part of the increase over 1959 is in Turkey, where a record crop is reported.

---

7/ From Foreign Agricultural Circular (Grain FG 2-61) January 1961. A revised statement will be published in Foreign Crops and Markets -- World Summaries, March 30, 1961.

Wheat production in Africa is placed at 205 million bushels, slightly above last year's harvest. The principal increase is in Algeria where a record crop of about 55 million bushels is reported, offsetting reductions in other countries.

In South America, the wheat crop, forecast at 275 million bushels, is well below average. The principal factor is the outlook for a smaller crop in Argentina. The current forecast of 190 million bushels is about 25 million bushels less than last year as well as below average. In contrast with that reduction, Uruguay's crop is getting back toward normal after 2 successive crop failures. The current estimate is about three times last year's low production.

In Australia, a record wheat crop is forecast. Current forecasts range from 225 to 250 million bushels. Last year's outturn was 198 million and the 1950-54 average was 181 million.

SUMMARY

The rye carryover on July 1, 1961, will be considerably above a year earlier as a result of the large 1960 crop. In spite of the substantial quantities of rye placed under price support, prices received by farmers have declined substantially from last year's level. Rye production in 1961 is presently projected at 28.7 million bushels based on the seedings report in December.

Rye Supply Larger Than Last  
Year and Above Average

The supply of rye for the 1960-61 marketing year is estimated at 45.1 million bushels (table 14). It consists of the carryover July 1, 1960 of 10.5 million, production of 32.1 million and imports of about 2.5 million <sup>8/</sup>. The supply this year is 15 percent above last year, and 4 percent above average. The larger supply is due to a 44 percent increase in the 1960 crop, much more than offsetting a decrease of 17 percent in the carryover.

<sup>8/</sup> The import control presently in effect expires on June 30, 1961. It stipulates that imports shall be limited to a total of 6.6 million bushels for the years 1959-60 and 1960-61. Since 4.2 million bushels were imported in 1959-60 an allotment of only 2.4 million is available for 1960-61. Small amounts of rye for seed are permitted to be imported ex-quota under specified conditions.

1/ Preliminary.

July-December Disappearance  
Above Last Year; Increase in  
Carryover Expected

Total disappearance of rye during July-December 1960 amounted to 19.2 million bushels, half a million more than in the same period of 1959 but slightly below the 1954-58 average (table 13). Exports totaled 2.9 million bushels, below both the 3.2 million exported in 1959 and the average of 4.1 million. The quantity used for food totaled 2.3 million bushels, about the same as last year but slightly below the average of 2.5 million. Alcohol and spirits production took 2.2 million bushels, about the same as in 1959. Seed use at 5.3 million bushels was unchanged from last year. Feed use, a residual item, at 6.6 million bushels was above the 5.6 million in the first half of the previous year and above the 5-year average.

Total disappearance of rye for the entire 1960-61 marketing year may exceed the 28.7 million bushels of 1959-60. The large increase in the 1960 crop over that of 1959 may continue to encourage heavier feeding during the second half of the year. Assuming that feeding of rye increases to 9 million bushels for the entire marketing year and that other domestic disappearance items and exports remain at about the 1959-60 level, disappearance may total 31 million bushels leaving a carryover on July 1, 1961 of about 14 million. The carryover would be above that of a year earlier and above the 1954-58 average.

Rye Seedings Unchanged

The rye acreage sown for all purposes in the fall of 1960 is estimated at 4.2 million acres, the same as a year earlier and slightly above the 10-year average of 4.1 million acres.

The acreage seeded was reduced in most of the important rye States. North Dakota was the exception with a sharp increase. Adequate moisture provided by late August rains promoted even stands and good germination. Short moisture supplies delayed seedings in Minnesota's rye areas. Dry conditions in western Nebraska and southwest and west central areas of South Dakota slowed seedings and retarded plant growth. Improved pasture conditions in eastern sections of these States relieved the need for rye pasture and contributed to the reduced acreage. Good moisture conditions provided Kansas and Oklahoma with favorable planting conditions and less need for rye pasture. Washington received light showers that provided some top soil moisture but the fall season was on the dry side.

Montana and New Mexico increased seedings but other Western States are unchanged or down from last year. Acreage increases are estimated in the northern tier of States from Wisconsin and Illinois east, except for Michigan, Pennsylvania and New Jersey. Good moisture supplies allowed larger acreage seedings in the South Atlantic States.

1/ U. S. monthly prices are the result of weighting monthly State prices by production through May 1957. Beginning June 1957 monthly State prices are weighted by estimated sales for the month. U.S. marketing-year prices are the result of weighting State season average prices by estimated marketings. Prices include an allowance for unredeemed loans at average loan rates. 2/ Computation of parity prices: Average price in base period (August 1909 to July 1914=72 cents per bushel) X monthly index of prices paid by farmers, interest and taxes, as revised January and October 1950 for the period 1926 through 1949. Transitional; 1950, 95 percent; 1951, 90 percent and 1952, 85 percent of parity formula in use prior to January 1950. Beginning January 1953, modernized parity. See Agricultural Prices, Bureau of Agricultural Economics, January 1950 and later issues. 3/ Monthly average of daily prices weighted by carlot sales. Compiled from the Minneapolis Daily Market Record.

One-third of the United States seedings were made in the Dakotas, Nebraska, Kansas and Washington, about the same as last year. Almost three-fifths of the 1960 crop was produced in these States. In North Dakota an estimated 411,000 acres were seeded, 25 percent above last year. Acreage in South Dakota, the second largest rye producing States, was reduced 8 percent.

The condition of rye on December 1, reported at 87 percent, reflected generally good growing conditions. This condition was 1 point above December 1, 1959 and 4 points above average. Snow cover was good in most Northern States and the crop went into the winter months in good condition except for Montana, and western areas of the Dakotas and Nebraska.

The first estimate of rye production for the 1961 crop will be made as of July 1, 1961. If it is assumed that 39.4 percent of the planted acreage is harvested, and yields equal to the average of the last 3 years of 17.4 bushels per acre are obtained, a crop of 28.7 million bushels would be produced. If domestic disappearance and exports are about the same as estimated for 1960-61, the carryover on July 1, 1962 would be slightly higher than the 14-million-bushel carryover indicated for the end of the current marketing year.

Rye Prices Average Lower  
This Year

On February 21, the price of No. 2 Rye at Minneapolis was \$1.08, about 3 cents above a month earlier but 1 cent below the effective loan. Prices during July-January this year averaged below the same period a year earlier. The average price received by farmers of 85.7 cents was down 13.8 cents per bushel.

Commodity Credit Corporation sales and dispositions of rye from July 1 to February 10 totaled 4.1 million bushels, of which 3.9 million were for export and the remainder for domestic sales.

As of January 31, 1961, 4.1 million bushels of rye had been placed under price support, of which 0.3 million bushels had been repaid. Purchase agreements totaled 0.7 million bushels. The quantity placed under price support a year earlier totaled 1.0 million bushels.

World Rye Production 11 Percent  
Below 1959 9/

World rye production in 1960 is estimated at 1,270 million bushels, 11 percent below the 1,435 million in 1959 and 13 percent below the 1950-54 average of 1,455 million (table 20).

Rye production is somewhat smaller than the 1959 harvest in both Europe and the Soviet Union, which together produce more than 90 percent of the world rye crop. Production in Europe is estimated at 690 million bushels, 7 percent below the large 1959 crop. Production in North America, at 41 million bushels, is above average.

---

<sup>1/</sup> Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere which immediately follow; thus, the crop harvested in the Northern Hemisphere in 1960 is combined with preliminary forecasts for the Southern Hemisphere harvests, which begin late in 1960 and end early in 1961. <sup>2/</sup> Figures refer to harvested areas as far as possible. <sup>3/</sup> Yield per acre calculated from acreage and production data shown. <sup>4/</sup> Revised estimates for Northern Hemisphere countries; for Southern Hemisphere, preliminary forecasts based largely on acreage and weather conditions to date. <sup>5/</sup> Estimated totals which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other producing countries not shown. <sup>6/</sup> Tentative unofficial estimates for production.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source material, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research and related information.

Carryover, June 30	55,530	45,453	75,556	79,114	153,197	112,228	
Total distribution	298,223	211,462	207,151	246,533	218,821	206,883	
Difference, unaccounted <sup>6/</sup>	-7,112	-7,819	-8,498	-14,832	-6,285	-4,046	

<sup>1/</sup> Preliminary.

<sup>2/</sup> Grain, only. Imports included with inshipments.

<sup>3/</sup> Partly estimated.

<sup>4/</sup> Includes an estimate of wheat purchased for feed by farmers from other farmers, but does not include "wheat, mixed feed" or other wheat residuals commonly used in prepared feeds.

<sup>5/</sup> Inspected exports, grain only.

<sup>6/</sup> Difference between total supplies and total distribution due to unrecorded truck inshipments and unknown errors in the estimates. Minus sign indicates total distribution exceeds total supply.

Data made possible by the Research and Marketing Administration, Northwest Wheat Project carried on jointly by the Oregon Wheat Commission, Washington State Department of Agriculture and Agricultural Estimates, Agricultural Marketing Service, United States Department of Agriculture.

Table 24.- Wheat: CCC sales and other dispositions, July-February 1960-61

Item	July 1, 1960 - February 10, 1961	
	<u>1,000 bushels</u>	<u>1,000 bushels</u>
<u>Domestic Sales and Dispositions</u>		
By CSS Commodity Offices:		
Nonstorable country warehouse	1,170	
Nonstorable track and terminal	2,757	
Statutory minimum <u>1/</u>	2,161	
Other domestic	121	
Donations	15	
By ASC County Offices:		
Nonstorable bin site	5	
Statutory minimum <u>1/</u>	<u>2,787</u>	9,016
<u>Export Sales and Dispositions</u>		
GR-345 and GR-368 <u>2/</u>	75,456	
Barter	17,842	
CCC credit <u>3/</u>	3,216	
Other export	4,050	
Donations	10,995	111,559
 Total sales and dispositions		 120,575

1/ For unrestricted domestic use.

2/ For redemption of certificates issued under payment-in-kind program.

3/ General Sales Manager's Credit Program; CCC sales made at the next export price.

1/ U.S. monthly prices are the result of weighting monthly State prices by production through May 1957. Beginning June 1957, monthly State prices are weighted by estimated sales for the month. U.S. marketing-year prices are the result of weighting State season average prices by estimated marketings. Includes an allowance for unredeemed loans at average loan values. 2/ Does not include bonus payment of 30 cents per bushel delivered under the Government purchase program. 3/ Computation of parity prices based on old formula: Average price in base period (August 1909 to July 1914=88.4 cents) X monthly index of prices paid by farmers, interest and taxes, as revised January and October 1950 for the period 1926 through 1949. Beginning January 1950, effective parity price based on old formula. January 1956 through December 1958, transitional parity. Beginning January 1959, modernized parity. 4/ Compiled from the Kansas City Grain Market Review. Average of daily prices weighted by carlot sales. 5/ Average for 11 months. 6/ Beginning July 1947, sales of Dark Hard and Hard Winter wheat combined, reported as Hard Winter.
